

$y = C(x - C)^2$. $y' = 2C(x - C)$. Обозначим $x - C = \delta$ и решим систему $\begin{cases} C\delta^2 = y \\ 2C\delta = y' \end{cases}$.

$$C\delta = \frac{y'}{2}, y = C\delta^2 = C\delta \cdot C = C \frac{y'}{2}, C = \frac{2y}{y'}. y' = \frac{4y}{y'} \left(x - \frac{2y}{y'} \right). (y')^3 = 4y(xy' - 2y).$$
